

ABSTRACT

The present invention relates to a method and system for providing conference call services in a VoIP local network. A VoIP communication station may be conferenced into a VoIP call between at least two other communication stations. In one embodiment, a Voice Conference Server device (VCS) receives a "join-call" signal or indication from a VoIP phone wishing to conference into a VoIP connection. The VoIP connection may be between at least one VoIP phone in a local network and a communication station such as a PSTN phone in a public network. The VCS sets up an RTP voice path and conferences in the VoIP communication station providing the "join-call" signal or indication.
